

ABSTRACT OF THE INVENTION

5 The invention is directed to novel indole peptidomimetic compounds
 which are useful as thrombin receptor antagonists for the treatment of diseases
 10 associated with thrombosis, restenosis, hypertension, heart failure, arrhythmia,
 inflammation, angina, stroke, atherosclerosis, ischemic conditions,
 Angiogenesis related disorders, cancer, and neurodegenerative disorders.
 Pharmaceutical compositions comprising the substituted indole
 peptidomimetics of the present invention and methods of treating conditions
 10 mediated by the thrombin receptor are also disclosed.
